

Harbinger

VAW Detection System

Harper Chalice
Integrated Perimeter Security Specialists

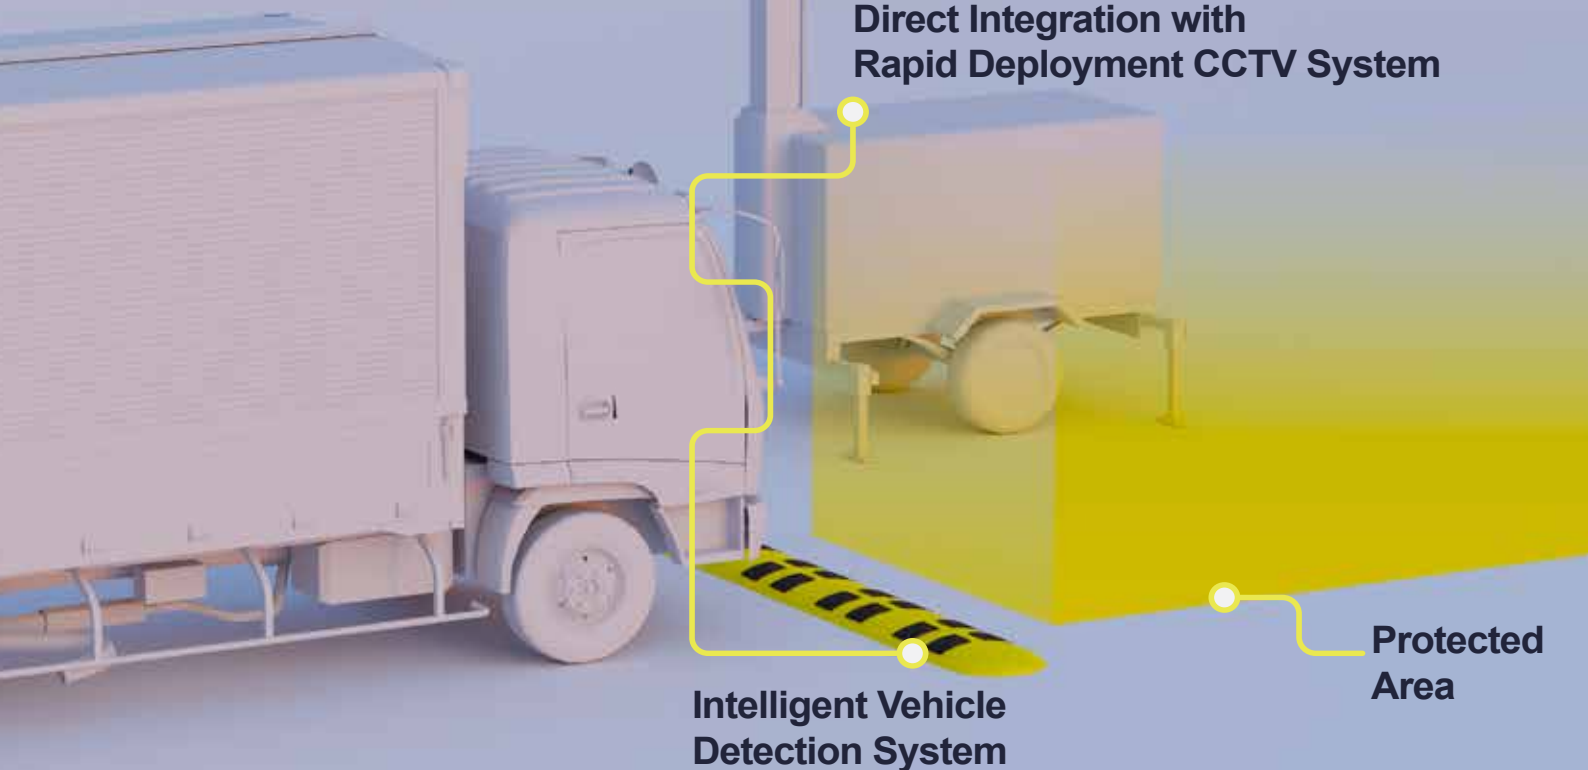

The Harbinger solution is a system designed to assist in the detection of vehicles in a sterile or closed off area. The detection of the vehicles in these areas is to provide early warning and detection of vehicles that could potentially be utilised for a Vehicle as a Weapon attack (VAW).

The system has been designed to be a flexible solution that can be deployed as either a permanent or temporary solution. The system involves the deployment of a speed ramp that contains our VibeWire detection cable that monitors the area for any vehicles crossing the speed ramp and providing alarms if a vehicle is detected.

The Harbinger has been tested and approved by CPNI for the early detection of vehicles and providing early detection of the presence of vehicles in a sterile location.

The system is modular and can be easily removed and redeployed. It can also provide integration into CCTV solutions or even into rapid deployable CCTV systems providing a complete rapid deployable solution with detection, verification and transmission of alarms and CCTV images.
